

EVHOE: Bay of Biscay Bottom Trawl survey data processing summary

fishglob, Aurore A. Maureaud & Juliano Palacios Abrantes & P.D van Denderen

January, 2023

Contents

General info	1
Data cleaning in R	1
1. Overview of the survey data table	23
2. Summary of sampling intensity	24
3. Summary of sampling variables from the survey	25
4. Summary of biological variables	26
5. Extreme values	27
6. Summary of variables against swept area	28
7. Abundance or Weight trends of the six most abundant species	29
8. Distribution mapping	30
9. Taxonomic flagging	31
10. Spatio-temporal standardization	32
a. Standardization method 1	32
b. Standardization method 2	35
c. Standardization summary	36

General info

This document presents the cleaning code and summary of the Bay of Biscay bottom trawl survey provided by DATRAS, ICES. It contains data from **1997** and up to **2020**.

Data cleaning in R

2. Summary of sampling intensity

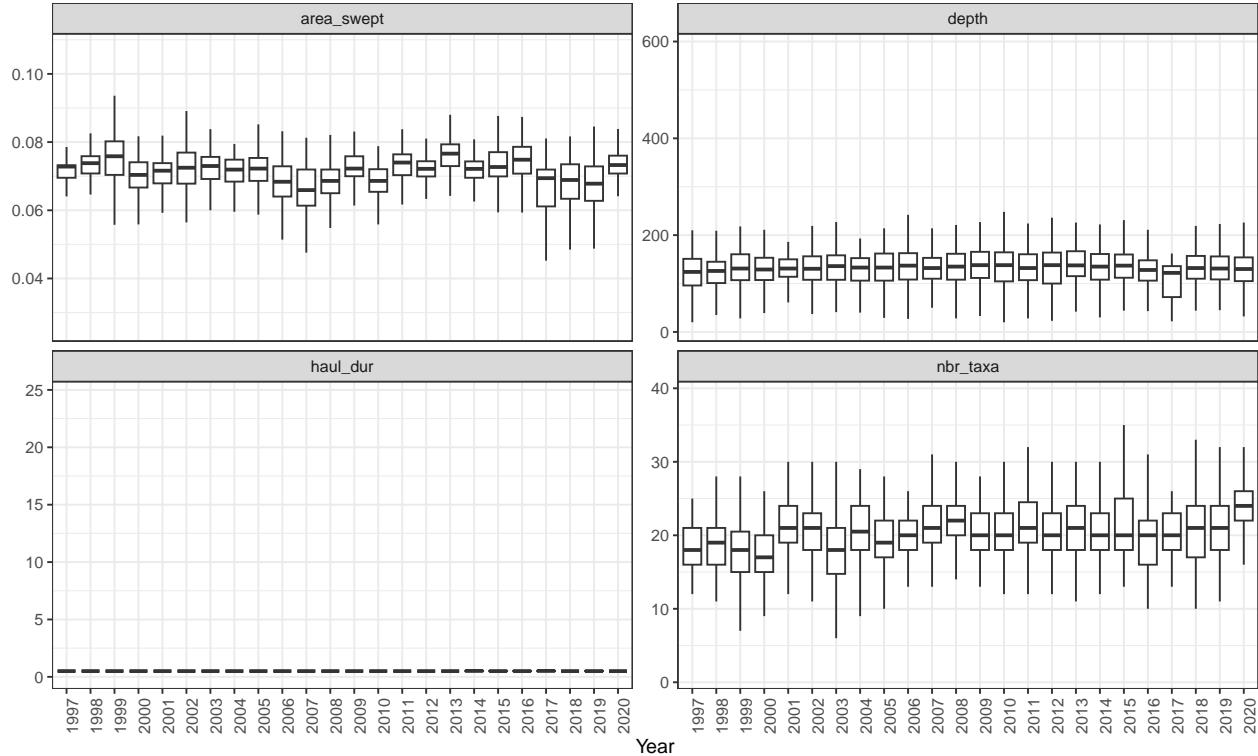

Number of hauls per year performed during the survey after data processing.

3. Summary of sampling variables from the survey

Here we show the yearly total and average of the following variables reported in the survey data:

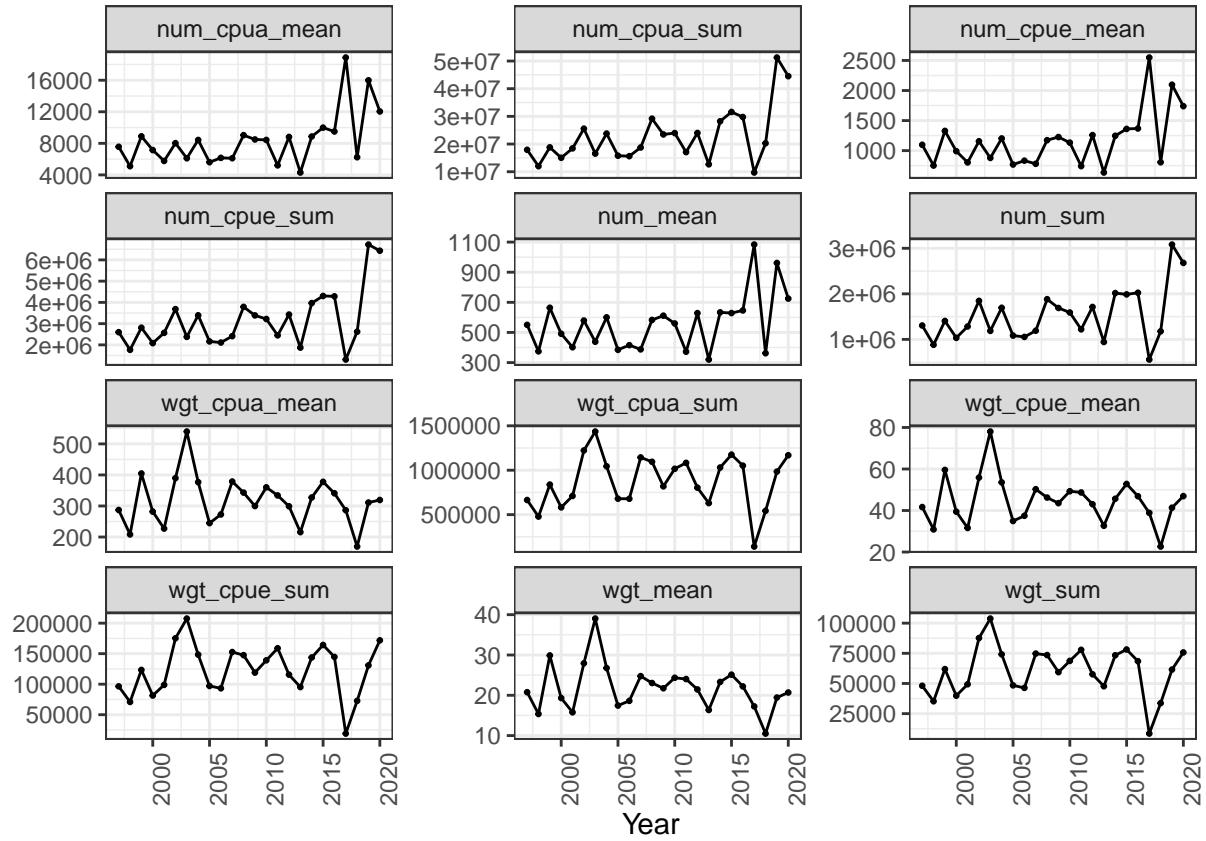

- *area_swept*, swept area by the bottom trawl gear km^2
- *depth*, sampling depth in m
- *haul_dur*, haul sampling duration *hours*
- *number of marine fish taxa*, taxa were cleaned following the last version of taxonomy from the World Register of Marine Species (<https://www.marinespecies.org/>, October 2021)

4. Summary of biological variables

Here we display the yearly total and average across hauls of the following variables recorded in the data:

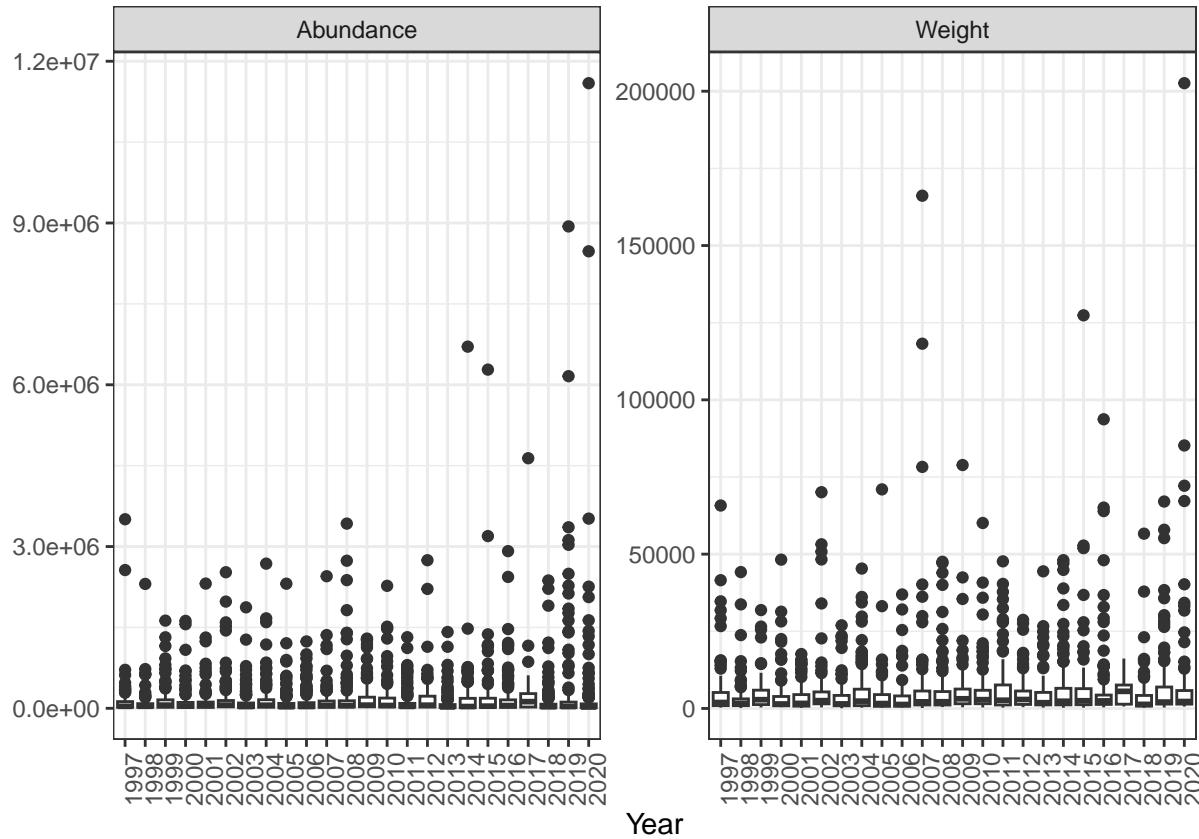

- num_cpua , number of individuals (abundance) in $\frac{individuals}{km^2}$
- num_cpue , number of individuals (abundance) in $\frac{individuals}{h}$
- num , number of individuals (abundance)
- wgt_cpua , weight in $\frac{kg}{km^2}$
- wgt_cpue , weight in $\frac{kg}{h}$
- wgt , weight in kg

5. Extreme values

Here we show a yearly total distribution of the biomass data to visualize outliers:

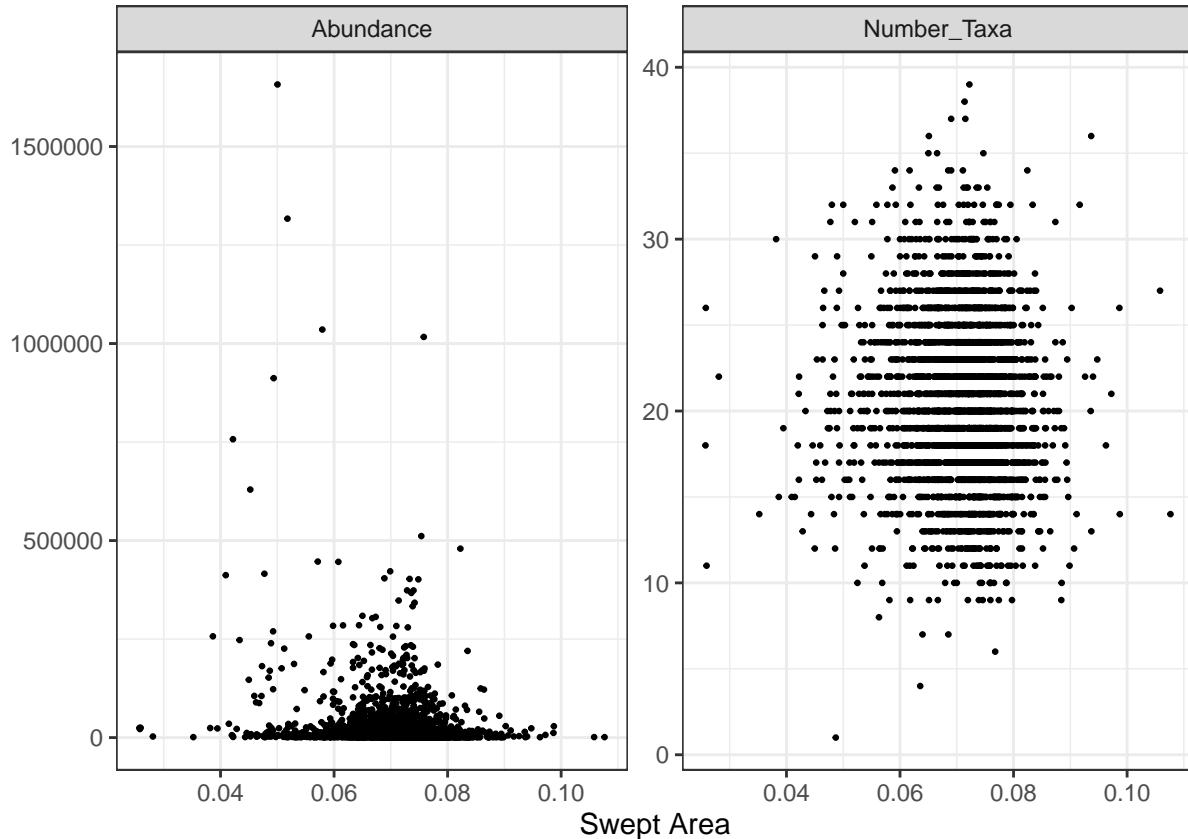

- num_cpue , number of individuals (abundance) in $\frac{individuals}{km^2}$
- wgt_cpue , weight in $\frac{kg}{km^2}$

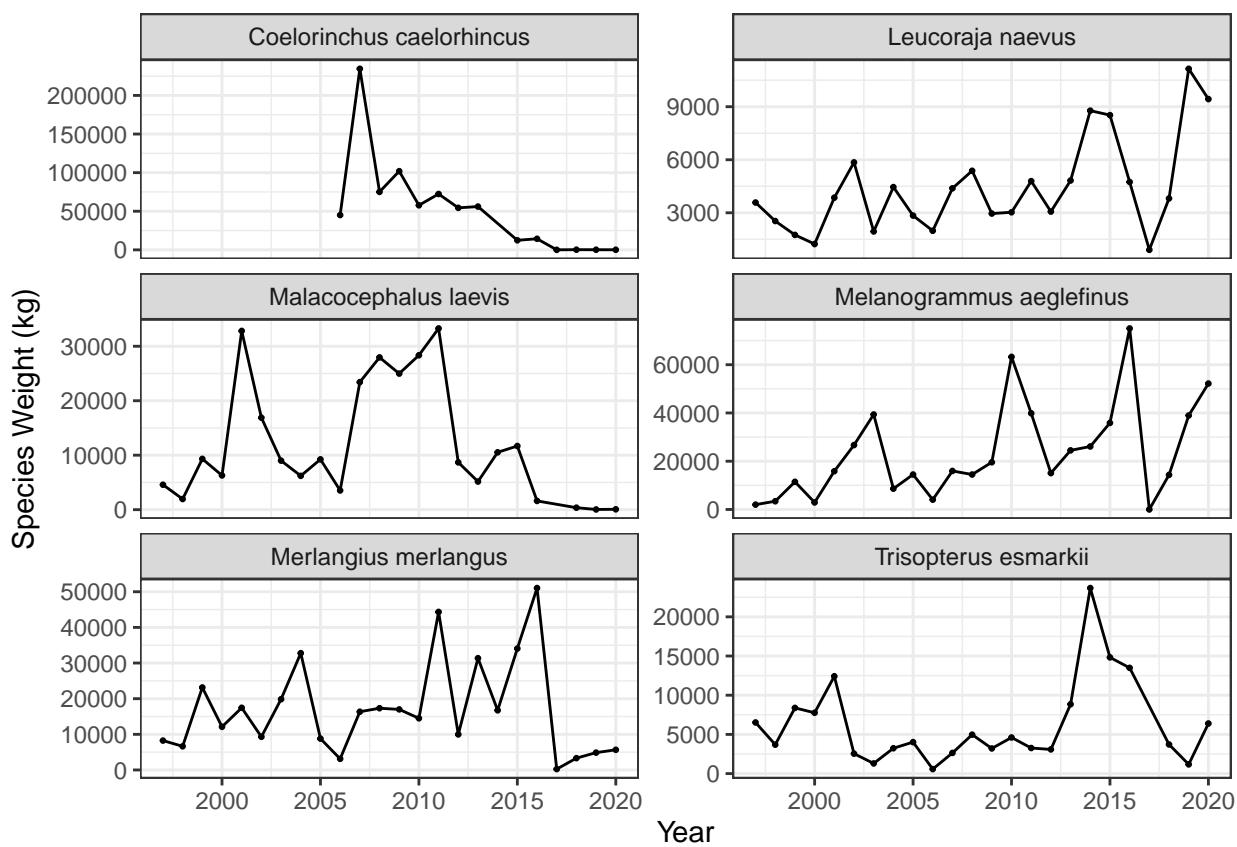

6. Summary of variables against swept area

Here we show the total abundance and number of taxa relationships with the area swept:

- nbr_taxa , number of marine fish taxa after taxonomic data cleaning
- num_cpua , number of individuals (abundance) in $\frac{individuals}{km^2}$
- wgt_cpua , weight in $\frac{kg}{km^2}$

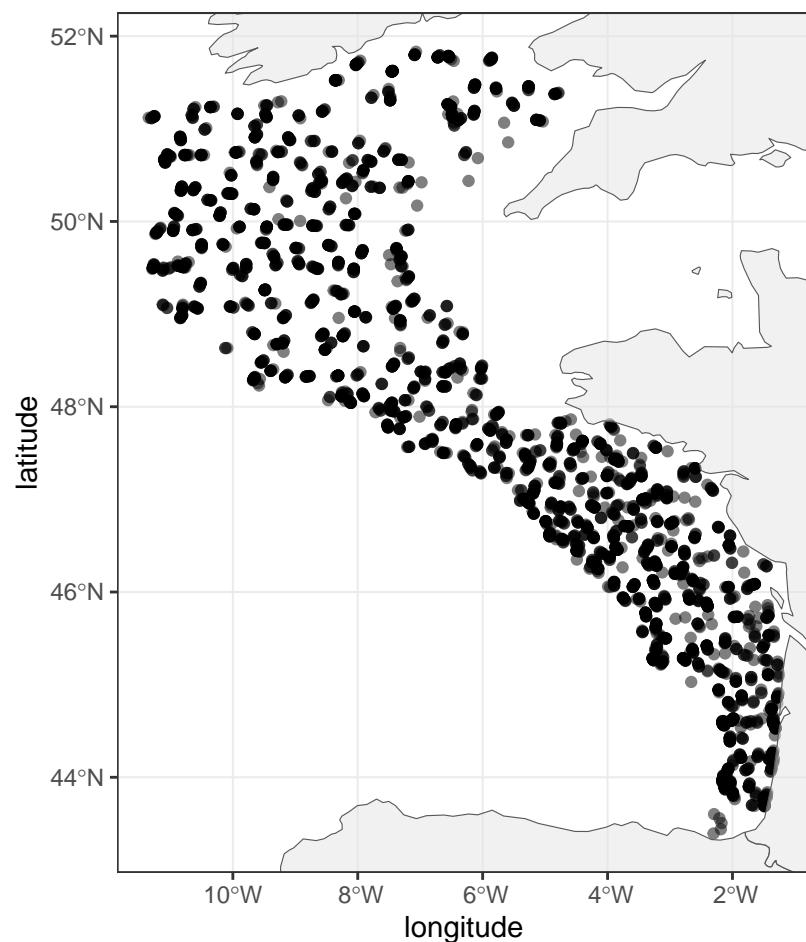

7. Abundance or Weight trends of the six most abundant species

8. Distribution mapping

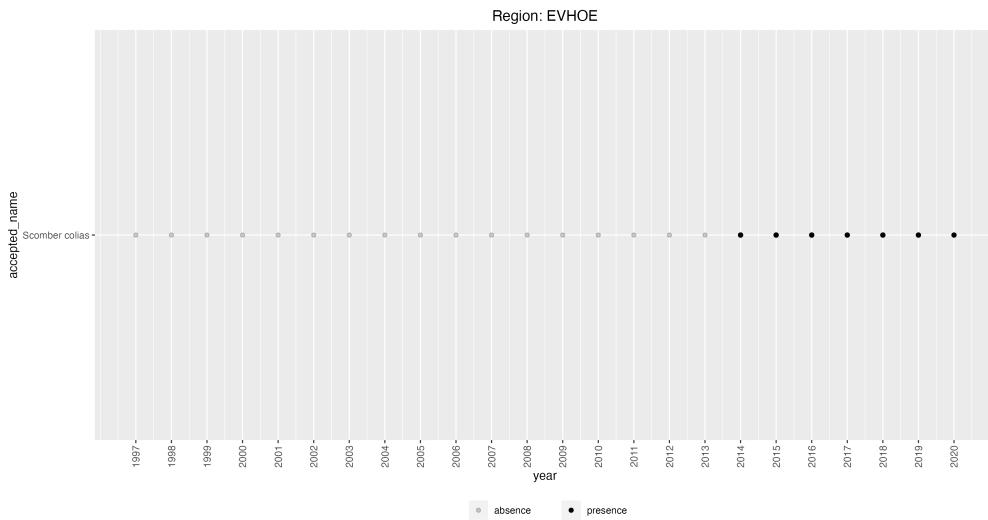

Map of the sampling distribution in space. Note that we only show one year per coordinate.

9. Taxonomic flagging

This species flagging method was adapted from <https://github.com/pinskylab/OceanAdapt/blob/master/R/add-spp-to-taxonomy.Rmd#L33>

Visualization of flagged taxa

Statistics related to the taxonomic flagging outputs

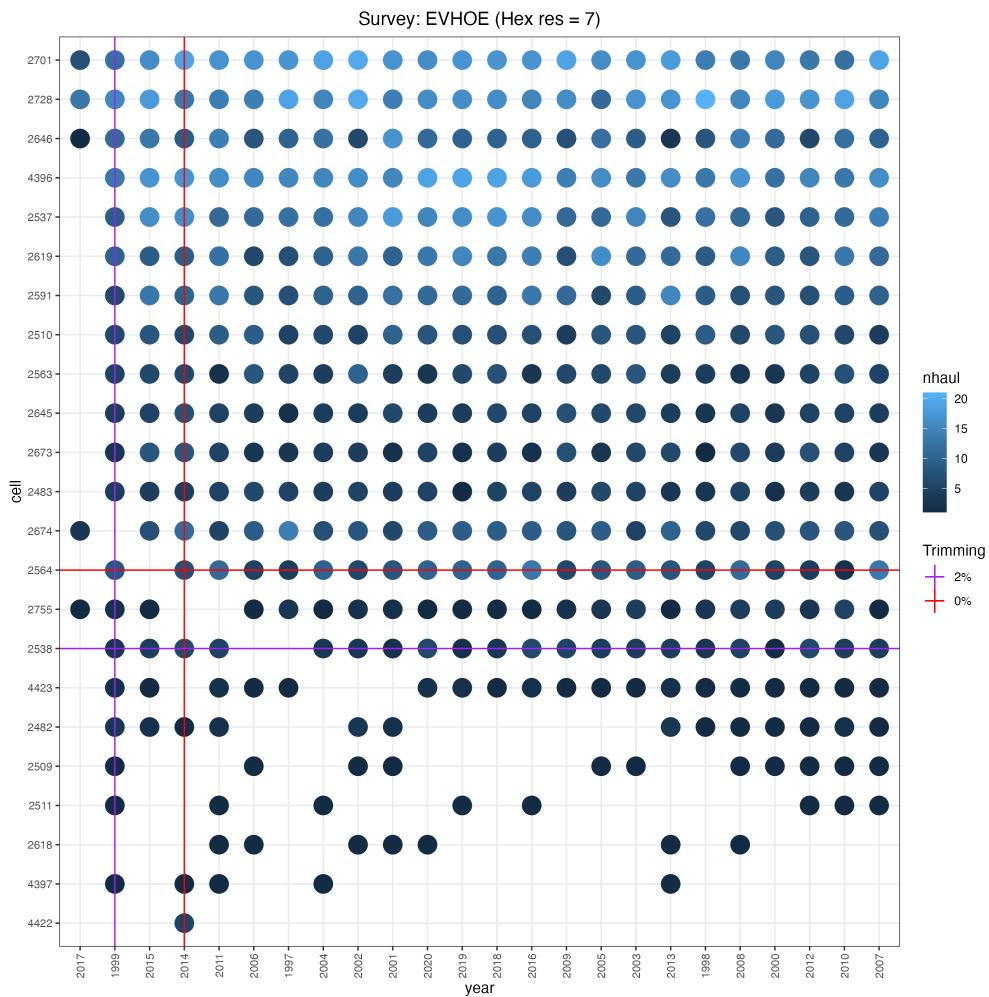

Total number of species	229.0
Percentage of species flagged	0.4

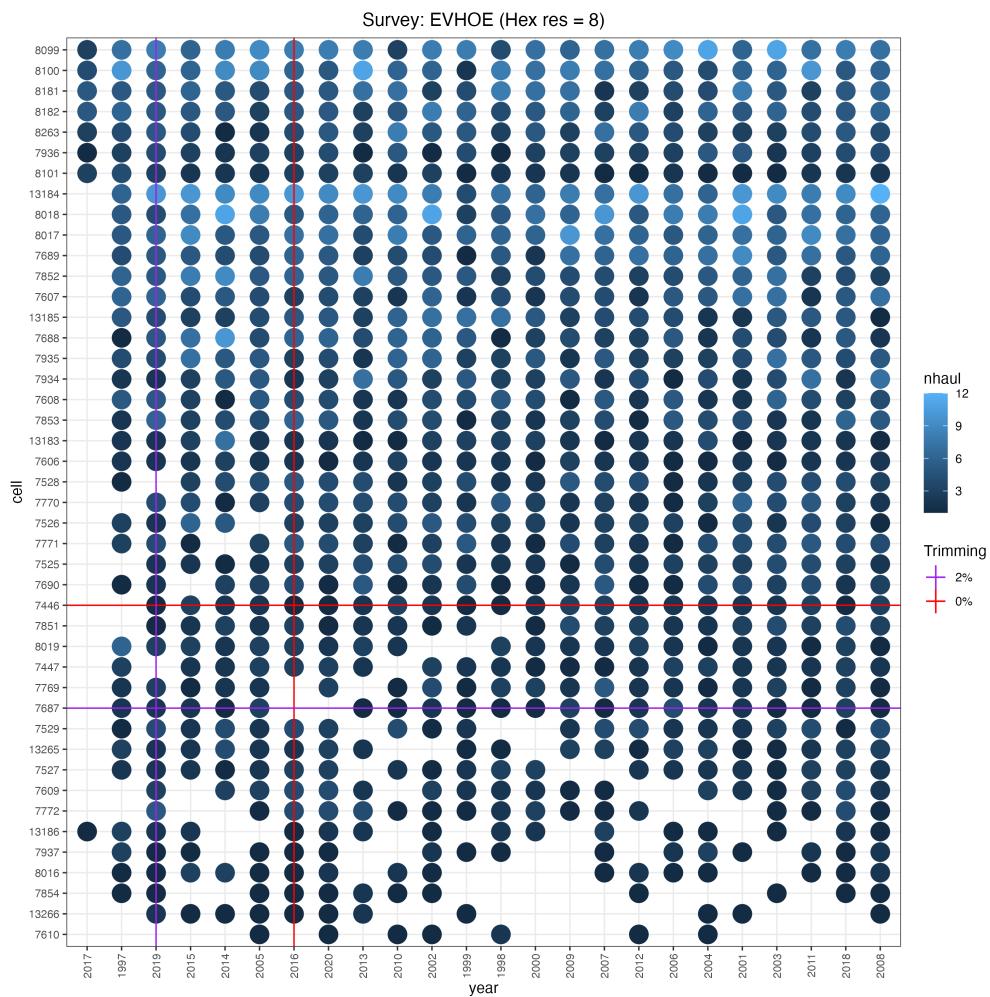

10. Spatio-temporal standardization

a. Standardization method 1

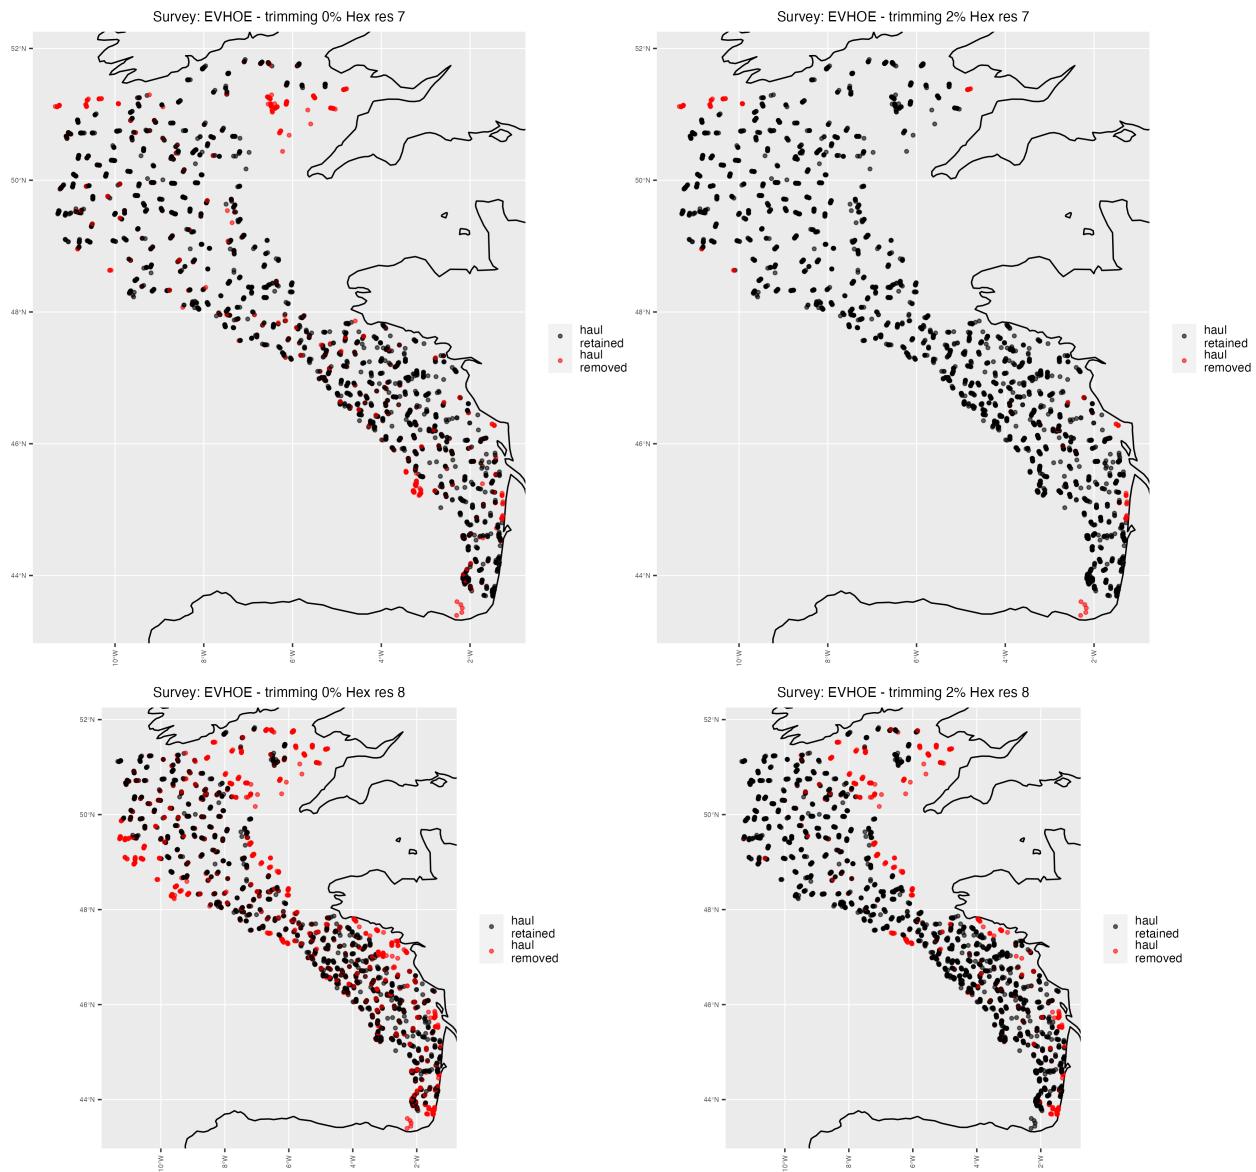

This standardization method was adapted from https://github.com/zoekitchel/trawl_spatial_turnover/blob/master/data_prep_code/species/explore_NorthSea_trimming.Rmd
It was run for hex resolution 7 and 8.

Plot of number of cells x years with overlaid flagging options

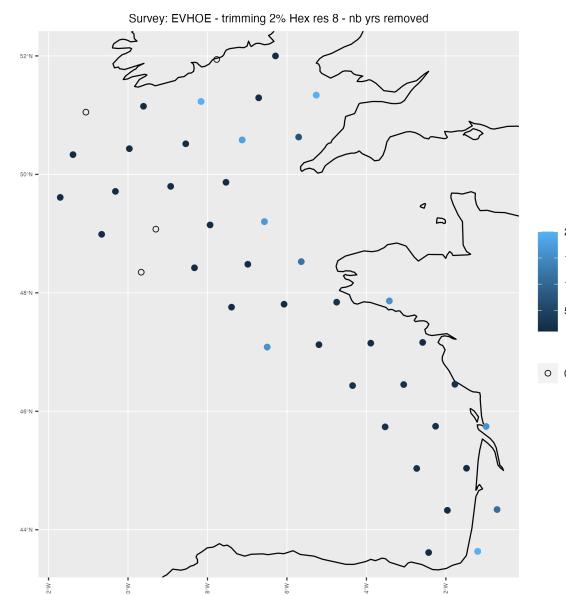

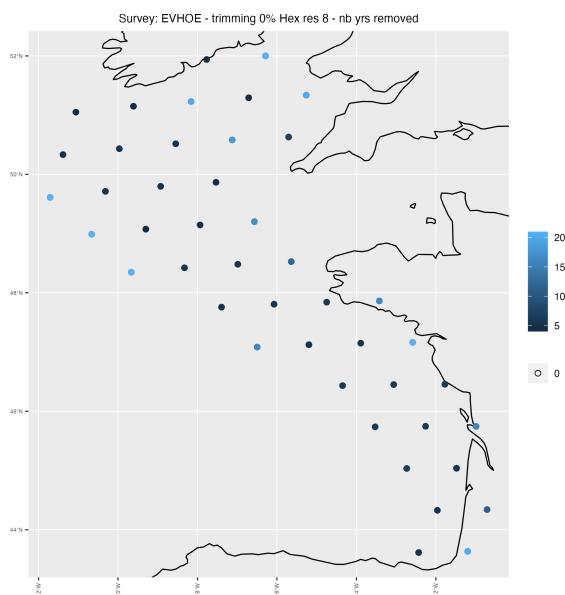

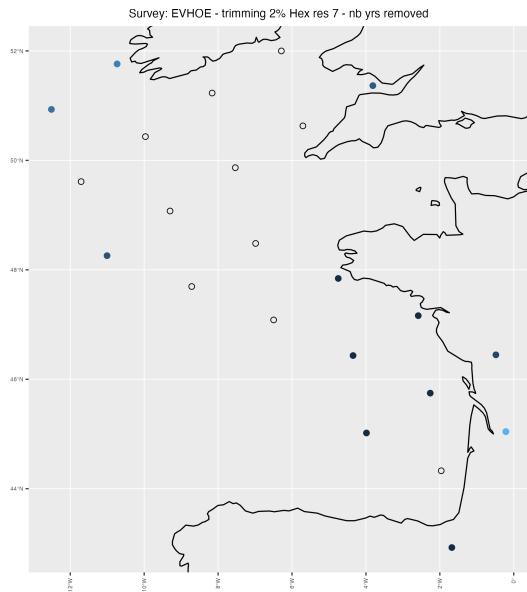

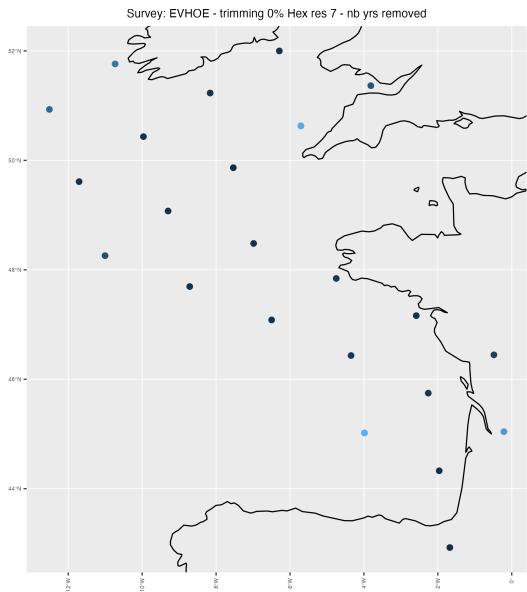

Map of hauls retained and removed per flagging method and threshold

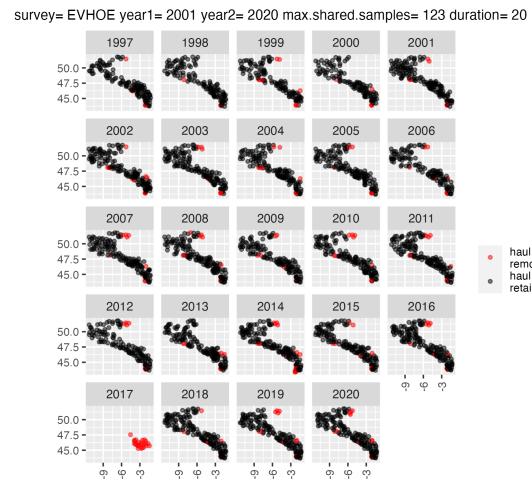

Map of numbers of years removed per grid cell and flagging method/threshold

b. Standardization method 2

This standardization method was adapted from BioTIME code from https://github.com/Wubing-Xu/Range_size_winners_losers

Map of hauls retained and removed

c. Standardization summary

Statistics of hauls removed for each standardization method

summary	grid cell 7, 0% threshold	grid cell 7, 2% threshold	grid cell 8, 0% threshold	grid cell 8, 2% threshold	method 2 (biotime)
number of hauls removed	484.0	109.0	1179.0	473.0	4289.0
percentage of hauls removed	14.7	3.3	35.9	14.4	6.4
